本說明書中所列參數如有更新，我司可能無法另行通知，產品詳細信息請參見我司規格書，產品參數以規格書為準。

If the parameters listed in this manual are updated, our company may not be able to give further notice. Please refer to our specifications for product details. The product parameters are subject to the specifications.

• 超級電容器簡介

超級電容器又稱為電化學雙電層電容器 (EDLC)，是擁有高能量密度的電化學電容器，比傳統的電解電容容量高上數百倍至千倍不等。超級電容器是一種介於傳統電容器和充電電池之間的新型綠色儲能裝置。

• 超級電容器原理

插入電解質溶液中的金屬電極表面與液面兩側會出現符號相反的過剩電荷，從而使相間產生電位差。那麼，如果在電解液中同時插入兩個電極，并在其間施加一個小於電解質溶液分解電壓的電壓，這時電解液中的正、負離子在電場的作用下會迅速向兩極運動，并分別在兩上電極的表面形成緊密的電荷層，即雙電層，它所形成的雙電層和傳統電容器中的電介質在電場作用下產生的極化電荷相似，從而產生電容效應，緊密的雙電層近似于平板電容器，但是，由於緊密的電荷層間距比普通電容器電荷層間的距離更小得多，因而具有比普通電容器更大的容量。雙電層電容器沒有傳統的電介質，而是使用絕緣體隔開。這個絕緣層可以讓電解液中的正負離子通過。該電解液本身不能傳導電子。所以當充電結束後，電容器內部不會發生漏電（電子不會從一極流向另外一極）。當放電的時候，電極上的電子通過外部電路從一極流向另外一極。結果是電極與電解液中的離子吸附顯著降低。從而使電解液中的正負離子重新均勻分布開來。

• 卷繞型超級電容器結構

• Supercapacitor Overview

Supercapacitors, also known as electrochemical double-layer capacitors (EDLC), are electrochemical capacitors with high energy density, which are several hundred to thousand times higher than conventional electrolytic capacitors. The supercapacitor is a new type of green energy storage device between the conventional capacitor and the rechargeable battery.

• Principle of Supercapacitor

When a metal electrode is inserted in the electrolyte, excess charge with opposite signs will be present at the metal/solution interfaces because of the potential difference between the two phases. If two electrodes are inserted in the electrolyte at the same time and a voltage lower than the decomposition potential of the electrolyte is applied, the anions and cations in the electrolyte will rapidly migrate to the electrodes under the electric field. Close charge layers will be formed at the two opposite surfaces of the electrodes, i.e., the electric double layer, which is similar to the polarized charge induced by the electric field in a conventional capacitor, therefore exhibiting a capacitive effect. Such that a close electric double layer is similar to the parallel plane capacitor. Since the close charge layer spacing is much narrower than the distance between ordinary capacitor charge layers, it has a larger capacitance than an ordinary capacitor. There is no traditional dielectrics in the double layer capacitors. Instead, they are separated by insulators. Anions and cations in the electrolyte can pass through the insulating layer, while electron can not be conducted in the electrolyte itself. Therefore, no leakage occurs within the capacitor when charging is completed (electrons do not flow from one electrode to the other). When discharging, the electrons on one electrode flow to the other via an external circuit. As a result, ion adsorption in the electrode and the electrolyte is significantly reduced. In this way, the positive and negative ions in the electrolyte are homogeneously redistributed.

• 產品特點

內阻低，功率密度高；

自放電率小，72小時自放電<20%；

優異的循環壽命，庫侖效率達95%以上；

工作溫度範圍寬；

綠色環保，滿足RoHS和REACH要求。

• Product Features

Low equivalent internal resistance, with high power density;

Low self-discharge rate, <20% within 72h;

Wonderful cycle life, with coulombic efficiency up to 95%;

Wide operating temperature range;

Green and environmentally friendly, complying with RoHS and REACH requirements.

• 典型應用

超級電容器主要用于能源儲存，而非通用電路元件，特別適用於精密能源控制和瞬間負載設備。超級電容器也有作為能量儲存和KERS設備在車輛使用，另外亦有用于其他小型系統，例如需要快速充/放電的家用太陽能系統。

• Typical Applications

Supercapacitors are mainly used for energy storage, rather than general-purpose circuit components, and are particularly suitable for precision energy control and instantaneous load equipment. Supercapacitors are also used in vehicles for energy storage and KERS device, but also for other small systems such as home solar systems that require fast charging/discharging.

• 典型應用（續）

智能家居：氣體傳感器、火災傳感器、RIP、溫控器、空調、電動窗簾開關、水晶面板開關、無線傳感器、門磁開關、e-h1+控制主機、電視、紅外發生器、緊急按鈕、監控主機、球形攝像頭、電話、個人電腦、手機、以太網。

5G終端：基站電源、微基站、5G基站。

軍用領域：電磁炮、彈射起飛、軍用備用電源。
可再生能源領域：風力發電、光伏發電系統。

• Typical Applications

Smart home: gas sensor, fire sensor, rip, temperature controller, air conditioner, electric curtain switch, crystal panel switch, wireless sensor, door magnetic switch, e-h1+ control host, TV, infrared generator, emergency button, monitoring host, spherical camera, telephone and Ethernet.

5G terminal: base station power supply, micro base station and 5g base station.

Military field: electromagnetic gun, ejection take-off, military standby power supply.

Renewable energy field: wind pitch, photovoltaic power generation system.

• 超級電容器基本充放電電路

限流電阻的大小主要取决于用户电源系统的功率；如果用户电源系统的功率比较大，那么限流电阻可以取小一点，如果电源功率比较小，那么电阻取大一些，同时注意电阻的功率，正常功率必须在1W以上。比如电源最大工作电流为1A，电压5V，那么限流电阻取5欧左右，功率为5W。此充电电路只限于内阻很小的超级电容，比如柱式超级电容，对于内阻比较大的超级电容，则无须限流电阻，比如扣式超级电容。放电二极管可以选取正向导通压降比较小的齐纳二极管，同时保证一定的功率。

• Basic Charging & Discharging Circuit for Supercapacitor

The value of the current limiting resistor depends on the power of the user's power system. If the power of the user's power system is relatively large, then the current limiting resistor can be smaller. If the power is relatively small, then the resistance is larger and the power of the resistor is taken into account. The normal power must be above 1W. For example, the maximum operating current of the power supply is 1A and the voltage is 5V. Then, the current limiting resistor is about 5 ohms and the power is 5W. The charging circuit is limited to supercapacitors with very small internal resistance, such as pillar-type supercapacitors. For supercapacitors with relatively large internal resistance, there is no need for current limiting resistors, such as button-type supercapacitors. The discharge diode can select a Zener diode with a relatively low forward voltage drop, while ensuring a certain power.

• 超級電容器的選型

超級電容器的兩個主要應用：高功率脈衝應用和瞬時功率保持。高功率脈衝應用的特徵：瞬時流向負載大電流；瞬時功率保持應用的特徵：要求持續向負載提供功率，持續時間一般為幾秒或幾分鐘。瞬時功率保持的一個典型應用：斷電時磁盤驅動頭的復位或者GPRS聯網時大電流脈衝補償。不同的應用對超電容的參數要求也是不同的。高功率脈衝應用是利用超電容較小的內阻(R)，而瞬時功率保持是利用超級電容較大的容量(C)。

• Selection of Supercapacitor

The two main applications of supercapacitors are: high power pulse applications and instantaneous power retention. The characteristics of high-power pulse applications are: instantaneous flow into the load with high current; characteristics of the instantaneous power retention application: the requirement to continuously provide power to the load, the duration is generally a few seconds or minutes. A typical application of instantaneous power retention: reset of the disk drive head during power off or high current pulse compensation during GPRS networking. Different applications have different parameter requirements for supercapacitors. High-power pulse applications utilize ultra-capacitor small internal resistance (R), while instantaneous power retention utilizes a large capacity (C) of the supercapacitor.

• 超級電容器的選型 (續)

下面提供了兩種計算公式和應用實例：

C(F): 超電容的標稱容量；
 R(Ohms): 超電容的標稱內阻；
 ESR(Ohms): 1KZ下等效串聯電阻；
 Vwork (V): 在電路中的正常工作電壓；
 Vmin (V): 要求器件工作的最小電壓；
 t(s): 在電路中要求的保持時間或脈衝應用中的脈衝持續時間；
 Vdrop (V): 在放電或大電流脈衝結束時，總的電壓降，其值等
 於Vwork-Vmin；
 I(A): 負載電流。

瞬時功率保持應用

超電容容量的近似計算公式，該公式根據，保持所需能量=超電容減少能量。
 保持期間所需能量= $1/2I(V_{work} + V_{min})t$ ；
 超級電容減少能量= $1/2C(V_{work2} - V_{min2})$ ，
 可得其容量(忽略由IR引起的壓降) $C = I t (V_{work} + V_{min}) / (V_{work2} - V_{min2})$
 經過公式變換，計算公式簡化為： $C = I * t / V_{drop}$

實例：

假設磁帶驅動的工作電壓5V，安全工作電壓3V。如果直流馬達要求0.5A保持2秒(可以安全工作)，那麼根據上公式可得其容量至少為0.5 F。

因為5V的電壓超過了單體電容器的標稱工作電壓。因而，可以將兩只電容器串聯。如果兩只相同的電容器串聯，那麼每只分壓即為其標稱電壓2.5V。

如果我們選擇標稱容量是1F的電容器，兩只串聯后的容量為0.5F。考慮到電容器一般有-20%的容量偏差，這種選擇不能提供足夠的余量。可以選擇標稱容量是1.5F的電容器，能提供 $1.5F/2=0.75F$ 。考慮-20%的容量偏差，最小值 $1.2F/2=0.6F$ 。這種超級電容器提供了充足的安全余量。大電流脈衝後，磁帶驅動轉入小電流工作模式，用超電容剩余的能量。

• Selection of Supercapacitor (cont.)

The following provides two calculation formulas and application examples:

C(F): Nominal capacity of the supercapacitor;
 R(Ohms): Nominal internal resistance of the supercapacitor;
 ESR (Ohms): Equivalent series resistance at 1 KZ;
 Vwork (V): Normal operating voltage in the circuit
 Vmin (V): Minimum voltage required to operate the device;
 t(s): Hold time required in the circuit or the pulse duration in the pulse application;
 Vdrop (V): The total voltage drop at the end of the discharge or high current pulse, whose value is equal to Vwork-Vmin;
 I(A): load current.

Instantaneous power retention application

The approximate calculation formula for the capacity of the supercapacitor is based on the principle of maintaining the required energy = supercapacitor to reduce energy.

The required energy during the holding period =
 $1/2I(V_{work} + V_{min})t$;
 Super capacitor reduces energy = $1/2C (V_{work2} - V_{min2})$,
 Available capacity (ignoring pressure drop due to IR) $C = I t (V_{work} + V_{min}) / (V_{work2} - V_{min2})$
 After formula transformation, the formula is simplified as:
 $C = I * t / V_{drop}$

Example:

Assume that the tape drive operates at 5V and the safe operating voltage is 3V. If the DC motor requires 0.5A for 2 seconds (can work safely), then according to the above formula can get at least 0.5F.

Because 5V voltage exceeds the nominal operating voltage of the monolithic capacitor. Thus, two capacitors can be connected in series. If two identical capacitors are connected in series, then each partial voltage is the nominal voltage of 2.5V.

If we choose a capacitor with a nominal capacity of 1F, the two connected series have a capacity of 0.5F. Considering that the capacitors generally have a -20% capacity deviation, this option does not provide enough margin. A capacitor with a nominal capacity of 1.5F can be selected and can provide $1.5F/2=0.75F$. Consider a -20% capacity deviation with a minimum of $1.2F/2=0.6F$. This super capacitor offers ample safety margin. After a large current pulse, the tape drive goes into a low-current mode of operation, using the excess energy of the supercapacitor.

• 超級電容器的選型(續)

脈衝功率應用

脈衝功率應用的特徵：和瞬時大電流相對的較小的持續電流。脈衝功率應用的持續時間從1ms到幾秒。

設計分析假定脈衝期間超級電容是唯一的力量提供者。在該實例中總的壓降由兩部分組成：由電容器內阻引起的瞬時電壓降和電容器在脈衝結束時壓降。關係如下：

$$V_{drop} = I(R + t/C)$$

上式表明電容器必須有較低的R和較高的C，總的壓降Vdrop才會比較小。

對於多數脈衝功率應用，R的值比C更重要。以2.5V 1.5F為例。它的內阻R可以用直流ESR估計，標稱是0.075Ohms(DC ESR=AC ESR*1.5=0.060Ohms*1.5=0.090Ohms)。額定容量是1.5F。對於一個0.001s的脈衝，t/C小於0.001Ohms。即便是0.01s的脈衝t/C也小於0.0067Ohms，顯然R(0.090Ohms)決定了上式的Vdrop輸出。

實例：

GSM/GPRS無線調制解調器需要每一間隔4.6ms達2A的電流，該電流持續0.6 ms。這種調制解調器現用在筆記本電腦的PCMCIA卡上。筆記本電腦電源最大可以提供1A的電流。許多功率放大器(PA)要求3.0V的最小電壓。對於筆記本電腦輸出3.0V的電壓是可能的。到功率放大器的電壓必須先升到3.6V。在3.6V的工作電壓下(最小3.0V)，允許的壓降是0.6V。

選擇超級電容器(C: 0.15F, AC ESR: 0.200Ohms, DC ESR: 0.250Ohms)。對於2A脈衝，電池提供大約1A，超電容提供剩余的1A。根據上面的公式，由內阻引起的壓降：1A × 0.25Ohms=0.25V。I(t/C)=0.04V它和由內阻引起的壓降相比是小的。

結論：

不管是功率保持還是功率脈衝應用都可以用上公式計算。當電路的工作電壓超過超電容的工作電壓時，可以用相同的電容器串聯。電容串聯應該保持平衡以確保電壓平均分配。

• Selection of Supercapacitor (cont.)

Pulse power application

Pulsed power applications are characterized by a small continuous current as opposed to an instantaneous large current. Pulse power applications last from 1ms to several seconds.

The design analysis assumes that the super capacitor is the only energy provider during the pulse. The total voltage drop in this example consists of two parts: the instantaneous voltage drop caused by the internal resistance of the capacitor and the voltage drop at the end of the pulse of the capacitor. The relationship is as follows:

$$V_{drop} = I(R + t/C)$$

The above formula shows that the capacitor must have a lower R and a higher C, and the total voltage drop Vdrop will be smaller.

For most pulsed power applications, the value of R is more important than C. Take 2.5V 1.5F as an example. Its internal resistance R can be estimated by DC ESR, nominally 0.075 Ohms (DC ESR=AC ESR*1.5=0.060Ohms*1.5=0.090Ohms). The rated capacity is 1.5F. For a 0.001s pulse, t/C is less than 0.001 Ohms. Even if the 0.01s pulse t/C is less than 0.0067 Ohms, it is clear that R (0.090 Ohms) determines the Vdrop output of the above equation.

Example:

The GSM/GPRS radio modem requires a current of 2A per interval of 4.6ms. This current lasts 0.6 ms. This modem is now used on PCMCIA cards in laptops. Laptop power can provide up to 1A of current. Many power amplifiers (PAs) require a minimum voltage of 3.0V. It is possible for the laptop to output a voltage of 3.0V. The voltage to the power amplifier must first rise to 3.6V. At an operating voltage of 3.6V (minimum 3.0V), the permissible voltage drop is 0.6V.

Supercapacitors were selected (C: 0.15F, AC ESR: 0.200 Ohms, DC ESR: 0.250 Ohms). For a 2A pulse, the battery provides approximately 1A and the supercapacitor provides the remaining 1A. According to the above formula, the pressure drop caused by the internal resistance: 1A × 0.25Ohms=0.25V. I(t/C)=0.04 V It is small compared to the pressure drop caused by the internal resistance.

Conclusion:

Both power retention and power pulse applications can be calculated using the above formula. When the operating voltage of the circuit exceeds the operating voltage of the supercapacitor, the same capacitor can be used in series. Capacitor series should be balanced to ensure even voltage distribution.

• 超級電容器的使用及注意事項

• Usage and Cautions

- 1、超級電容器的壽命主要受工作電壓和溫度的聯合影響。如果長期置于高溫、高電壓下，其結果將會導致壽命縮短，極端情況下，電壓引起的產品失效將導致單體漏液或氣體泄漏。
 - 2、如果在一個方向上長期充電後再進行反向充電，超級電容的壽命將會大大的縮短，因此保持極性十分重要。
 - 3、高于額定溫度上限使用將導致單體的使用特性和壽命嚴重惡化。惡化程度與超過上限溫度多高和持續時間多長成正比。典型影響包括容量快速下降，ESR上升，電解液分解內部產生大量氣體，最終導致單體漏液或氣體泄漏。。
 - 4、單個超級電容器單體的電壓有限，必須串聯超級電容器以達到要求的電壓。由於每個超級電容器在電容和阻抗上有輕微的公差，必須均衡或防止單個超級電容器超過額定電壓。
 - 5、不要在以下環境中貯存超級電容器：
 - a、高溫/高濕環境。
 - b、陽光直射，粉塵環境。
 - c、直接與水、鹽水、油或其它化學品接觸。
 - d、直接與腐蝕性材料、酸、鹼金屬或有毒氣體接觸。
 - e、衝擊或振動環境。
- 1、The life of supercapacitor mainly depends on work voltage & temperature. If put supercapacitor in high temperature & high voltage environment, it will shorten the lifetime of supercapacitor. In the extreme case, it will lead to cell leakage or gas leakage when product failure caused by voltage.
 - 2、It is important to keep right polarity, because it will greatly shorten the life of supercapacitors when charge it in one polarity and then reverse charge.
 - 3、It will greatly damage supercapacitor function performance & lifetime when the temperature exceeds rated temperature. The damage intensity for supercapacitor is proportional to how much it exceeds the rated temperatures and the duration times. Typical effects include rapid decline in capacitance, ESR increase and gas generated from decomposition of the electrolyte, finally lead to supercapacitor leakage or gas leakage.
 - 4、Single supercapacitor voltage is too low for most application, so it needs connect in series to get the needed voltages. Since each single supercapacitor with slight tolerance on capacitance & resistance, the connected supercapacitor shall have equivalent or prevent a single supercapacitor exceeds the rated voltage.
 - 5、Do not store supercapacitor in any of the following environments:
 - a、High temperature/high humidity environments.
 - b、Direct sunlight, dust environment.
 - c、Direct contact with the water, salt, oil or other chemicals.
 - d、Direct contact with corrosive materials, acids, alkalis or toxic gases.
 - e、Shock or vibration environments.

• 緊急情況處理

漏液情況處理:

- 1、皮膚接觸: 用肥皂水和清水徹底衝洗皮膚。
- 2、眼睛接觸: 用流動清水或生理鹽水衝洗, 就醫。
- 3、吸取: 立即用水漱口, 就醫。

如果發現超級電容器過熱或是聞到氣味, 應立即斷開與超級電容器連接的電源和負載, 讓其降溫, 然後進行正確處理, 不可讓臉或手接觸過熱的超級電容器。

• Emergency Treatments

Leakage case:

- 1、Skin contact: Use soap and water thoroughly wash skin.
- 2、Eye contact: Flush with flowing water or saline, and ask for medical treatment.
- 3、Draw: Immediately wash with water and ask for medical treatment.

Disconnect the power supply & load connected with supercapacitor, once supercapacitor overheat or smells. Lower its temperature, avoid direct face or hands for overheated supercapacitors.

• 波峰焊推薦溫度曲線

1、短時間內按照以下焊接條件, 開展低溫焊接工作。

2、PCB只應從底部進行預熱, 預熱時間不超過60秒, 對于厚度等於或大於0.8 mm的PCB, 電路板的頂部溫度應在100°C以下。

3、有關更多焊接的條件請諮詢我們。

• Wave-Soldering Curve

1、The products should be soldered under the following conditions.

2、The PCB should be preheated only from the bottom and for less than 60 seconds, with temperature at, or below, 100°C on the top side of the board for PCBs equal to or greater than 0.8 mm thick.

3、For more information on soldering, please contact us.

九、鋰離子電容器 LIC Lithium ion Supercapacitor

■ 特性表 Specifications

參數 Parameters	主要特性 Performance Characteristics	備註 Notes
容量標稱範圍 Nominal Capacitance Range	10F~220F	
容量允許偏差 Capacitance Tolerance	-20%~+20%	@20°C
額定電壓 Operating Voltage Range	3.8V~2.5V	DC
浪涌電壓 Surge Voltage	4.2V	DC
使用溫度範圍 Operating Temperature Range	-20°C~+70°C	
循環壽命 Cycle Life	≥200,000Cycles	@25°C
溫度特性 Temperature Characteristics	在-20°C~+70°C 的溫度範圍內，應滿足規範要求 The specifications shall be met at category temperature range from -25°C to 70°C	
	容量變化 Capacitance Change	初始值的50%以內 within 50% of the initial value.
高溫負荷壽命 High Temperature Load Life	內阻 Internal Resistance	初始值的10倍以下 Less than 1000% of the initial value.
	在70°C施加額定電壓1000小時後，應滿足規範要求 The specifications shall be met after rated voltage applied at 70°C for 1000 hours	
	容量變化 Capacitance Change	初始值的30%以內 within 30% of the initial value.
	內阻 Internal Resistance	初始值的3倍以下 Less than 300% of the initial value.

● 產品規定值及尺寸

Specifications and Outline Dimensions of Product

型號 Part Number	額定電壓 U _R (V)	額定容量 Rated Cap. (F)	最大等效內阻 Max ESR DC (mΩ)	額定電流 Rated Current (A)	產品尺寸 Size / mm D×L
FH3R8M106M-N0813	3.8	10	1200	0.05	8×13
FH3R8M406M-N0820	3.8	40	500	0.20	8×20
FH3R8M706M-N1020	3.8	70	300	0.35	10×20
FH3R8M107M-N1025	3.8	100	220	0.50	10×25
FH3R8M127M-N1030	3.8	120	200	0.60	12.5×25

注：可根據客戶要求進行訂制。

Note: Custom specifications are supported.

● 產品外形圖及尺寸 Products Outline and Dimensions (mm)

十、超級電容器極片 Supercapacitor Electrodes

■ 特性表 Specifications

參數 Parameters	特性 Characteristics	參數 Parameters	特性 Characteristics
產品型號 Product Model	HCH230	集流體寬度 ($\pm 5 \mu m$) Current Collector Width	250
集流體厚度 ($\pm 1 \mu m$) Current Collector Thickness	22	塗布寬度 ($\pm 0.5mm$) Coating Width	220
電極厚度 ($\pm 5 \mu m$) Electrode Thickness	230	面密度 ($\pm 0.05g/dm^3$) Sheet Density	1.35
壓實密度 ($\pm 0.005 g/cm^3$) Pressed Density	0.65	面容量 (F/m^3) Sheet Capacitance	13000
