

HA1366W/WR

5.5W AUDIO POWER AMPLIFIER

Hitachi HA1366W/HA1366WR is a class-B power amplifier designed especially for car radios and car stereo amplifiers encapsulated in a plastic single-in-line package, and is capable of driving low impedance loads down to 2 ohms.

The HA1366W/HA1366WR provides an output power of 5.5 watts to 4 ohm load with 10 percent distortion at 13.2 volts, and also 6.6 watts to 4 ohm load with 10 percent distortion at 14.4 volts.

It exhibits high output current capability up to 4.5 amperes, very low harmonic distortion and cross-over distortion.

(SP-10TA)

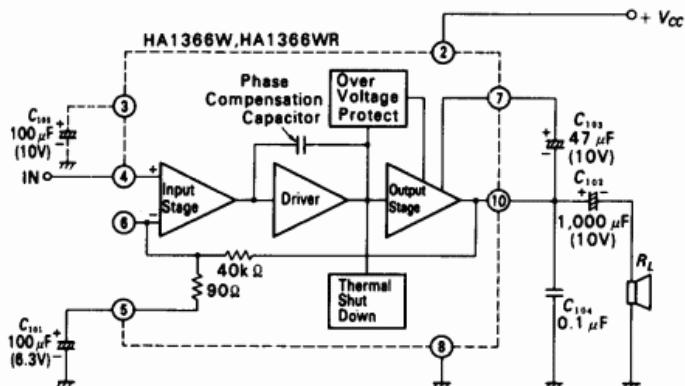

■ FEATURES

- Two kinds of pin configuration are available: normal (HA1366W) and reverse (HA1366WR) for easier layout design of pc-board when used in stereo applications
- Only a few number of external components:
 - three electrolytic capacitors
 - one polyester film capacitor
- Easy to mount a chassis by heat-sink, due to the single-in-line package with no electrical isolation
- Thermal shut-down circuit provided:

If the chip temperature reaches 150°C, the output power and current drain are automatically reduced to maintain the device safely.

- Ovvoltage handling capability up to 40 volts for 200 msec pulse duration
- No damage for reverse insertion on the pc-board
- Using BTL connection, output power of 13 watts at 10 percent distortion is obtained with 4 ohm load at 13.2 volts.

■ BLOCK DIAGRAM AND TYPICAL APPLICATION CIRCUIT

Notes: 1. Terminals 1 and 9 have no connection.
2. Recommended capacitor for C_{104} is a non-inductive polyester film type or the equivalent.
3. When the shock noise occurring on supplying the power is to be reduced, the addition of C_{105} (100μF) is desirable.
However, C_{105} is changed to 47μF when the C_{105} is used.

4. The terminal 6 is for gain adjustment. When a resistor is connected between pin 6 and 5, G_V comes higher. When a resistor and a capacitor are series connected between pin 6 and 10, G_V is reduced. Lower G_V than 40 dB is not recommended.

■ ABSOLUTE MAXIMUM RATINGS ($T_a = 25^\circ\text{C}$)

Item	Symbol	Rating	Unit	Notes
DC Supply Voltage	V_{CC}	18	V	1
Peak Supply Voltage ($t = 200\text{ms}$)	V_{surge}	40	V	
Output Current	$I_{O(\text{peak})}$	4.5	A	2
Power Dissipation ($T_c = 78^\circ\text{C}$)	P_T	7.2	W	
Junction Temperature	T_j	150	$^\circ\text{C}$	
Thermal Resistance	$\theta_{j-\text{c}}$	10	$^\circ\text{C/W}$	
Operating Temperature Range	T_{opr}	-20 to +70	$^\circ\text{C}$	3
Storage Temperature Range	T_{stg}	-55 to +125	$^\circ\text{C}$	

Notes : 1. Standard operating voltage is 13.2V

2. $I_{O(\text{peak})}$ is determined from the ratio of V_{CC} to R_L

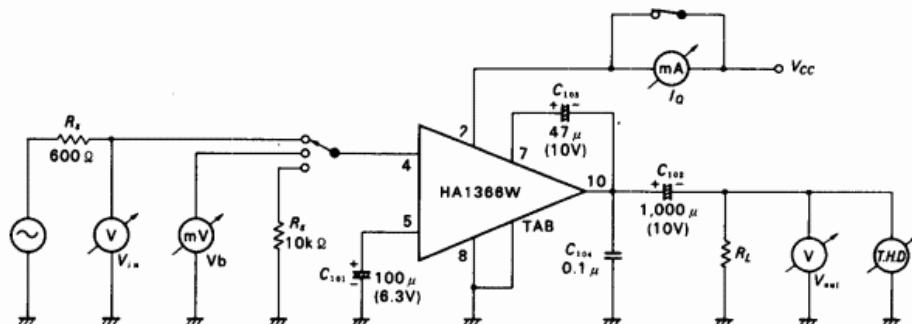

3. The value when 2.8 watts are dissipated mounted on an aluminium plate
($20\text{cm}^2 \times 1.5\text{mm}$). 2.8 watts is a maximum dissipation at $V_{CC} = 13.2\text{V}$

■ ELECTRICAL CHARACTERISTICS ($T_a = 25^\circ\text{C}$)

Item	Symbol	Test Conditions	min	typ	max	Unit
Quiescent Current	I_Q	$V_{in} = 0$	—	30	60	mA
Input Bias Voltage	V_b	DC Biasing Point between 4 and GND	—	—	20	mV
Voltage Gain	G_V	$f = 1\text{kHz}$	50	52.5	55	dB
Output Power	P_o	$f = 1\text{kHz}, T.H.D = 10\%$	4.5	5.5	—	W
Total Harmonic Distortion	T.H.D	$f = 1\text{kHz}, P_o = 0.5\text{W}$	—	—	1.5	%
Noise Output	V_N	$R_g = 10\text{k}\Omega, BW = 20 \text{ to } 20\text{kHz}$	—	—	2.0	mV
Input Resistance	R_{in}	$f = 1\text{kHz}$	—	24	—	k Ω

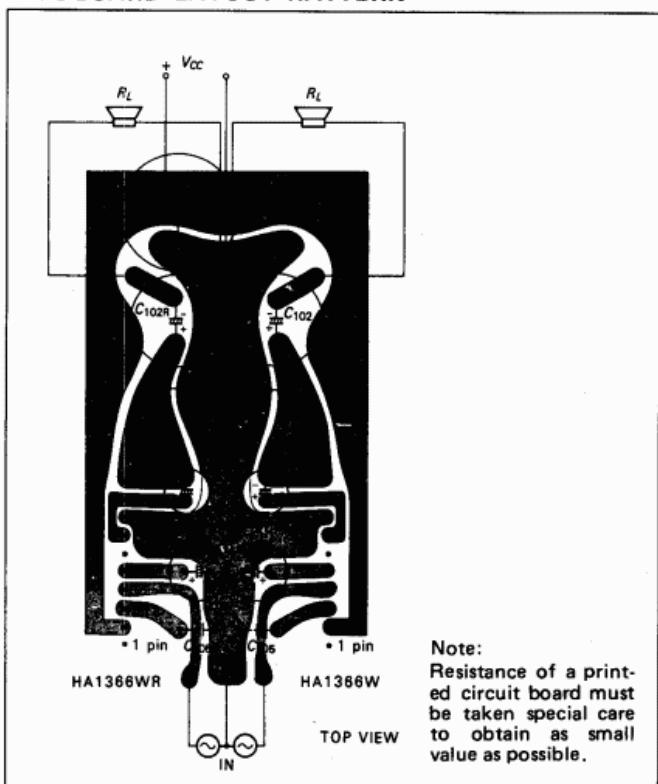

Note : Standard test conditions are : $V_{CC} = 13.2\text{V}$, $R_L = 4\Omega$, $R_g = 600\Omega$
